What to check first

Note: Refinement found a better solution with different credible sets. Compare the before and after sets below.

Check: 2 credible set(s) from the baseline disappeared in at least one sensitivity setting. See which settings lost them in the recovery table.

Main results and resolution

2 retained credible sets among 200 analyzed variants; 2 active components. A retained CS is a posterior candidate set, not a confirmed causal effect count.

Component ID (zero-based fit row)	Representative	CS size	Posterior mass	Minimum |r|	Effective number of variants
1	90	2	> 0.9999	0.9989	1.595
2	33	1	1	1	1
